## Fred,

These tables show there is basically no difference between tuning parameter settings. I used an 80/20 split for training/testing.

The variable importance scores were done using setting 13. The 5-fold cross validation cross validation scores I showed you this morning were done using setting 1. I would suggest setting 1 if we use gbm for the final models.

```
id = interaction.depth
bf = bag.fraction
sh = shrinkage
```
